STUDIES OF BLAST FURNACE PHENOMENA

Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1874 Excerpt: .100, arising from the hydrated state of the ores. Yield in twenty-four hours, 24 tons of gray forge iron. Charges--hydrated ore in grains, with--slag from forge, contains about 40 as a mean. Consumption per lb. of iron, i 1-145 at 17 of ash and 3 of u coke l water, or 0916 pure carbon. ores 2-547 flux 0-906 Slag produced. 1-470 This is again an example of economical working, and if we apply to this the methods of calculation above given in detail for Pouzin, we should again find a high value for the ratio CO₂---. An increase in height would certainly not diminish CO the consumption, already very low. 9 The only possible economy is that which would result from the use of higher temperature of blast. If now I am asked whence arises this great difference between the working of the French furnaces here named and those of the older types of Cleveland, I can only suggest the following reasons: --1. The section of the French furnaces is generally more tapering than that of English furnaces. Hence there is a better distribution of the gases; the reduction goes on in the upper regions with a less combustion of solid carbon. It has been already remarked that it is to this difference in section, in shape, that part of the economy of the furnace of Clarence 1866, compared to Ormesby 1867, and Clarence 1853, is to be attributed. 2. The manner charging is more studied...
